

Week 8 Research

Question 1: What is CSS clearfix, how is it used, and why is it helpful?

A: clearfix is used with floats. If an image is “floated” outside of its container because it is too big to fit – you can use Clearfix { overflow: auto } (a shorter, less reliable version) to make all of the content within that div/class adjust to fit all the content inside.

Below is a more stable/safer version of clearfix.

```
.clearfix::after {  
  content: "";  
  clear: both;  
  display: table;  
}
```

Question 2: What is your favorite thing you learned this week?

A: I spent some time with my mentor setting up my Promineo work folder to be a repo with every week of our program being a series of branches off of main. It was pretty cool seeing the gitflow and watching how sectioned off the folder becomes, and how safe it is to use for source control when working in team environments – or even sometimes by myself.
