

Week 7 Research

What are 3 HTML elements not mentioned in any of the videos this week? What do they do and how are they used?

`<style>` tag – it's a way to apply CSS directly in a HTML document instead of linking the CSS from a different file.

`<nav></nav>` - Basically acts as a div, but signifies where your navigation bar is being changed/modified

`<blockquote>` - Pretty self explanatory – typically used when you have an extended quotation. Can use the “cite” attribute to link a URL to the source of the quote.

What is your favorite thing you learned this week?

I took a bit of a step outside of HTML and learned about recursive functions – haven't quite gotten to an applicable situation yet but they're pretty cool!
